SUMMARY

Senior frontend engineer with 10+ years shipping React, TypeScript, and real-time web products — design systems, Core Web Vitals—driven performance, and accessible UX at scale. Selected impact includes 25% conversion lift, 50% UI render-time reduction, and product surfaces used by 50M+ users. Strengths include microfrontends architecture, component systems, streaming/real-time interfaces, WCAG-minded accessibility, and conversion-focused product UI.

TECHNICAL SKILLS

Frontend: React, Next.js, TypeScript, JavaScript, component libraries, hooks/context state, WebSockets, Server-Sent Events

Frontend Architecture: microfrontends, shell + feature modules, independently deployable UI packages, shared design-system packages

UI & Accessibility: responsive layout, semantic HTML, ARIA patterns, keyboard navigation, focus management, WCAG-oriented reviews

Performance: lazy loading, memoisation, virtualization, bundle/code-splitting, render profiling, pagination, perceived-latency UX

Design & Delivery: design systems, Storybook-style component docs, visual regression gates, CI/CD for frontend releases

Tooling: Vite/Webpack, ESLint, browser DevTools, AWS-hosted static assets, Docker, monitoring dashboards

EXPERIENCE

Frontend Developer | 2026 – Present

Happening Today

- Own React/TypeScript product UI on a microfrontends architecture — shell plus independently deployable feature modules, shared design-system packages, and Git-driven UI configuration for consistent branding across workflows.
- Improve Core Web Vitals and perceived performance via code splitting, lazy loading, memoisation, and bundle-size budgets — profiling render paths and tightening LCP/CLS on high-traffic surfaces.
- Ship accessible, keyboard-first interfaces (semantic HTML, ARIA patterns, focus management) and partner with design on mockup-to-production handoffs for core customer workflows.
- Deliver a federated streaming module (Server-Sent Events) with progressive loading, backpressure-aware clients, and CI release regression gates so UI defects never reach production.

Frontend Engineer | 2024 – 2025

MIRA

- Shipped React/TypeScript microfrontend modules for GenAI features used by 50M+ users — shared design-system components, API-backed state sync, and independently deployed discovery, search, and streaming packages.
- Built discoverability UIs with fast filters, virtualized result lists, and resilient empty/error states — code-split routes and pagination to keep bundle weight and interaction latency low on large catalogs.
- Raised accessibility and responsive-design bar on production surfaces — WCAG-minded reviews, styled-component theming aligned to product guidelines, and keyboard-navigable flows across search and browse.
- Integrated Jest/Vitest visual and functional regression gates into GitLab CI/CD, blocking releases on UI regressions and sustaining high code-review quality across the frontend squad.

Frontend Technical Lead | 2022 – 2024

Delta Exchange

- Built a React component library and shared state layer, cutting feature UI delivery time and lifting conversion by 25%.
- Owned real-time trading UI for a derivatives platform serving 5M+ users — order book rendering, WebSocket feed wiring, and low-latency price/position displays.
- Improved end-to-end trading UI responsiveness by 60% via render optimisation, feed batching, and legacy React refactor (fewer re-renders, clearer state boundaries).
- Led UI technical debt cleanup — migrated callback-heavy React patterns to modern async flows, cutting UI-related defect rate by 40%.
- Drove accessibility and keyboard-first patterns on critical trading paths (focus order, ARIA live regions for price updates).

Frontend Developer | 2019 – 2022

BetterPlace

- Introduced frontend performance patterns (lazy loading, memoisation, virtualized lists, pagination) that reduced UI render times by 50%.
- Built enterprise SaaS UI modules (workforce management, compliance workflows) in React — complex forms, role-based views, and large-table UX for big worker datasets.
- Designed client-side data presentation patterns (batched table loads, optimistic updates) that kept heavy enterprise datasets usable without blocking the main thread.
- Split monolith UI into independently deployable frontend packages, improving release cadence and safer UI rollbacks.

Software Developer | 2015 – 2019

Liftoff Pvt Ltd & Daffodils Software

- Shipped React and Angular UI modules — reusable components, responsive layouts, and third-party widget integration.
- Implemented accessible form patterns and cross-browser UI QA on customer-facing web applications.
- Delivered early-career frontend features across multiple web products (routing, state, and API-backed views).
