---

## SUMMARY

Software architect with 10+ years designing scalable application architectures, API platforms, and integration boundaries for production systems. Selected impact includes 50M+ user-scale systems, 60% system performance improvement, 3x throughput improvement, 40% bug-rate reduction. Strengths include application architecture, integration design, scalability planning, and hands-on delivery across cloud-native stacks.

## TECHNICAL SKILLS

**Architecture:** Application architecture, system design, API design, integration patterns

**Engineering:** React, Node.js, Python, TypeScript, distributed systems

**Cloud:** AWS, Docker, Kubernetes, CI/CD

**Platform Quality:** Reliability patterns, performance budgets

## EXPERIENCE

---

### Software Architect | 2026 – Present

*Happening Today*

- Defining application architecture for a production API platform — streaming and synchronous endpoints (Server-Sent Events + Node.js) with clear integration boundaries, backpressure controls, and scalability patterns for high-volume responses.
- Owning integration boundaries between product APIs, configuration services, and observability — structured configuration versioning in Git and contract-first patterns for safe cross-service change.
- Establishing technical standards for platform reliability — automated regression checks, release regression suites, latency/cost dashboards in CloudWatch, and quality regression rate alerting.
- Scaling API platform throughput under load — request budget management and graceful fallback on payload limit overflow without degrading downstream integration points.

### Application Architect | 2024 – 2025

*MIRA*

- Architected application architecture for backend and API platforms powering product features at 50M+ user scale — production search and content system with indexing, service orchestration, and managed APIs.
- Defined integration boundaries and service contracts between search, content, and response layers to enable modularity, reuse, and safe evolution of SaaS-scale capabilities.
- Planned scalability for high-traffic read paths — indexing strategy, orchestration patterns, and capacity alignment across distributed backend services.
- Drove adoption of technical standards in CI/CD — regression gates to catch deployment and integration regressions before release.

### Technical Lead / Senior Software Engineer | 2022 – 2024

*Delta Exchange*

- Designed and built core trading engine features for a real-time derivatives platform serving 5M+ users — Order book rendering, WebSocket feed management, and margin calculation APIs.
- Refactored legacy service architecture to reduce inter-service latency, achieving a 60% system performance improvement measured end-to-end.
- Built a React component library and shared state management layer, cutting UI feature development time significantly and boosting conversion by 25%.
- Led technical debt reduction initiative: migrated critical services from callback-heavy Node to async/await patterns, reducing bug rate by 40%.

## Senior Software Engineer | 2019 – 2022

*BetterPlace*

- Migrated monolith features to independently deployable microservices, improving deployment frequency and reducing rollback risk.
- Built scalable SaaS modules (workforce management, compliance workflows) using React, Python (Django/Flask), and Node.js.
- Designed a batched data ingestion pipeline that increased system throughput by 3x, enabling the platform to onboard enterprise clients with large worker datasets.
- Introduced frontend performance patterns (lazy loading, memoisation, pagination) that reduced UI render times by 50%.

## Software Developer | 2015 – 2019

*Liftoff Pvt Ltd & Daffodils Software*

- Built REST APIs.
- Delivered full stack features across web applications in early-career roles.
- Integrated third-party services, and shipped React/Angular frontend modules.
