SUMMARY

Senior backend engineer with 10+ years building Python and Node.js services, APIs, data pipelines, distributed systems, and production platforms on AWS. Selected impact includes 3x throughput improvement, 60% system performance improvement, 50M+ user-scale systems, 40% bug-rate reduction. Strengths include Python/Node.js services, API design, data pipelines, distributed systems, and production reliability on AWS.

TECHNICAL SKILLS

Backend: Python, Node.js, TypeScript, REST, GraphQL, microservices, event-driven systems

Data: PostgreSQL, Redis, MongoDB, Elasticsearch, Kafka, RabbitMQ

Cloud: AWS, Docker, Kubernetes, CI/CD, Terraform

Reliability: Production monitoring, caching, rate limiting, incident response

EXPERIENCE

Backend Engineer | 2026 – Present

Happening Today

- Design and maintain scalable Python and Node.js APIs plus a streaming layer (Server-Sent Events) for high-volume product responses — backpressure, request budgets, and graceful fallback on payload limit overflow.
- Own reliability for distributed backend services: structured configuration versioning in Git, automated regression checks, CloudWatch latency/cost dashboards, and quality regression rate alerting.
- Build and operate production APIs with observability and incident-ready monitoring — prioritizing low-latency throughput, safe degradation under peak load, and post-release care.
- Partner with frontend, QA, and platform peers to ship secure, testable backend changes through CI/CD and release regression suites.

Backend Engineer | 2024 – 2025

MIRA

- Built and scaled Python and Node.js backend services and APIs powering product features for 50M+ users — production search and content systems with indexing, orchestration, and managed integration endpoints.
- Designed PostgreSQL schemas and tuned queries for high-scale content and search workloads — improving reliability and performance under sustained production traffic.
- Implemented distributed-system patterns (caching, async pipelines, event-driven coordination) to support low-latency APIs and data-intensive features at 50M+ user scale.
- Integrated CI/CD regression gates and production monitoring to catch deployment regressions early and improve platform reliability.

Technical Lead / Senior Backend Engineer | 2022 – 2024

Delta Exchange

- Designed and built core trading engine features for a real-time derivatives platform serving 5M+ users — Order book rendering, WebSocket feed management, and margin calculation APIs.
- Led technical debt reduction initiative: migrated critical services from callback-heavy Node to async/await patterns, reducing bug rate by 40%.
- Refactored legacy service architecture to reduce inter-service latency, achieving a 60% system performance improvement measured end-to-end.
- Built a React component library and shared state management layer, cutting UI feature development time significantly and boosting conversion by 25%.

Backend Developer | 2019 – 2022

BetterPlace

- Built scalable SaaS modules (workforce management, compliance workflows) using React, Python (Django/Flask), and Node.js.
- Migrated monolith features to independently deployable microservices, improving deployment frequency and reducing rollback risk.
- Designed a batched data ingestion pipeline that increased system throughput by 3x, enabling the platform to onboard enterprise clients with large worker datasets.
- Introduced frontend performance patterns (lazy loading, memoisation, pagination) that reduced UI render times by 50%.

Software Developer | 2015 – 2019

Liftoff Pvt Ltd & Daffodils Software

- Built REST APIs.
- Delivered full stack features across web applications in early-career roles.
- Integrated third-party services, and shipped React/Angular frontend modules.
