SUMMARY

Founding engineer profile with 10+ years building and scaling full-stack, AI, fintech, and SaaS products from architecture through production ownership. Selected impact includes 50M+ user-scale systems, 35% inference cost reduction, 60% system performance improvement, 3x throughput improvement. Strengths include end-to-end product engineering, architecture, rapid delivery, production ownership, and scaling systems into reliable platforms.

TECHNICAL SKILLS

0-to-1 Product Engineering: architecture, full stack delivery, production monitoring

Stack: React, Next.js, Node.js, Python, TypeScript, AWS

Systems: Distributed systems, performance, databases, messaging, CI/CD

EXPERIENCE

Founding Engineer | 2026 – Present

Happening Today

- Building 0→1 platform from scratch: architected and shipped a Node.js + Server-Sent Events streaming API for high-volume product responses with backpressure, request budgets, and graceful fallback on payload limits.
- Own product surfaces end to end — from API design through deploy — with full-stack ownership across backend delivery and production hardening; no hand-offs between layers.
- Stood up production operations from zero: Git-versioned configuration, automated regression checks, release regression suite, CloudWatch latency/cost dashboards, and quality regression rate alerting.
- Bias to speed with real stakes: hunt critical-path issues, harden core performance, and keep live systems reliable while shipping continuously.

Principal Product Engineer | 2024 – 2025

MIRA

- Owned core backend systems 0→1 at scale: built production search and content services for 50M+ users using indexing, service orchestration, and managed APIs — from architecture through shipped product.
- Full-stack founding-style delivery: scoped problems, designed data and service layers, integrated APIs, and shipped features end to end without a ticket queue or PM-defined roadmap.
- Built and ran production systems under real load: hardened high-traffic search/content pipelines and kept performance stable as usage grew.
- Embedded CI/CD regression gates to ship fast without breaking production — catching deployment regressions before release at millions-of-users scale.

Technical Lead / Senior Software Engineer | 2022 – 2024

Delta Exchange

- Refactored legacy service architecture to reduce inter-service latency, achieving a 60% system performance improvement measured end-to-end.
- Designed and built core trading engine features for a real-time derivatives platform serving 5M+ users — Order book rendering, WebSocket feed management, and margin calculation APIs.
- Built a React component library and shared state management layer, cutting UI feature development time significantly and boosting conversion by 25%.
- Led technical debt reduction initiative: migrated critical services from callback-heavy Node to async/await patterns, reducing bug rate by 40%.

Full Stack Product Engineer | 2019 – 2022

BetterPlace

- Built scalable SaaS modules (workforce management, compliance workflows) using React, Python (Django/Flask), and Node.js.
- Designed a batched data ingestion pipeline that increased system throughput by 3x, enabling the platform to onboard enterprise clients with large worker datasets.
- Introduced frontend performance patterns (lazy loading, memoisation, pagination) that reduced UI render times by 50%.
- Migrated monolith features to independently deployable microservices, improving deployment frequency and reducing rollback risk.

Software Developer | 2015 – 2019

Liftoff Pvt Ltd & Daffodils Software

- Delivered full stack features across web applications in early-career roles.
- Built REST APIs.
- Integrated third-party services, and shipped React/Angular frontend modules.
